

Our Technology

4-Strand

With a snappy feel, our four-strand ropes are tolerant of all types of weather and have improved durability. They are designed for smaller crowns for a slick, fast loop. The fourth strand adds more weight and body.

3-Strand

Perfect for beginning ropers, our three-strand ropes aid in tip identification and are more forgiving. Three-strands also have taller crowns for better tip identification and to prevent running on the horn.

100% Nylon

Ropes made of only nylon are normally handle hot weather or hot conditions better.

Nylon/Poly Blend

A mixture of nylon and poly that capitalizes on the benefits of each material.

100% Poly

Ropes made from 100% poly have very little or no stretch.

Diameter

Our scientifically engineered rope making process gives us the opportunity to offer various rope diameters, measuring in smallest, small, medium and true. A rope's diameter determines the body, weight and lay.

Hot Weather

Although our pros use all of our ropes year-round, there are certain ropes that we suggest for hot weather. They are 100% nylon.

Cool Weather

Although our pros use all of our ropes year-round, the ropes that we suggest for cooler weather have poly in them to replicate the weight and body that nylon loses in cooler weather.

All Weather

These ropes perform equally in hot or cold weather.

Cactus Grip

Cactus Grip means that when the rope tightens between the saddle horn and the steer, the crowns of the rope separate slightly allowing the rope to hold the horn. It's minimal when you talk about stopping the clock, but huge when you talk about "gripping" the horn.

Body

Body is what enables a loop to stay open when you swing and throw.

Revolutions

Each of our ropes are scientifically engineered and designed with a specific number of revolutions to ensure consistent performance you can trust.
